

HES for Gas Metering

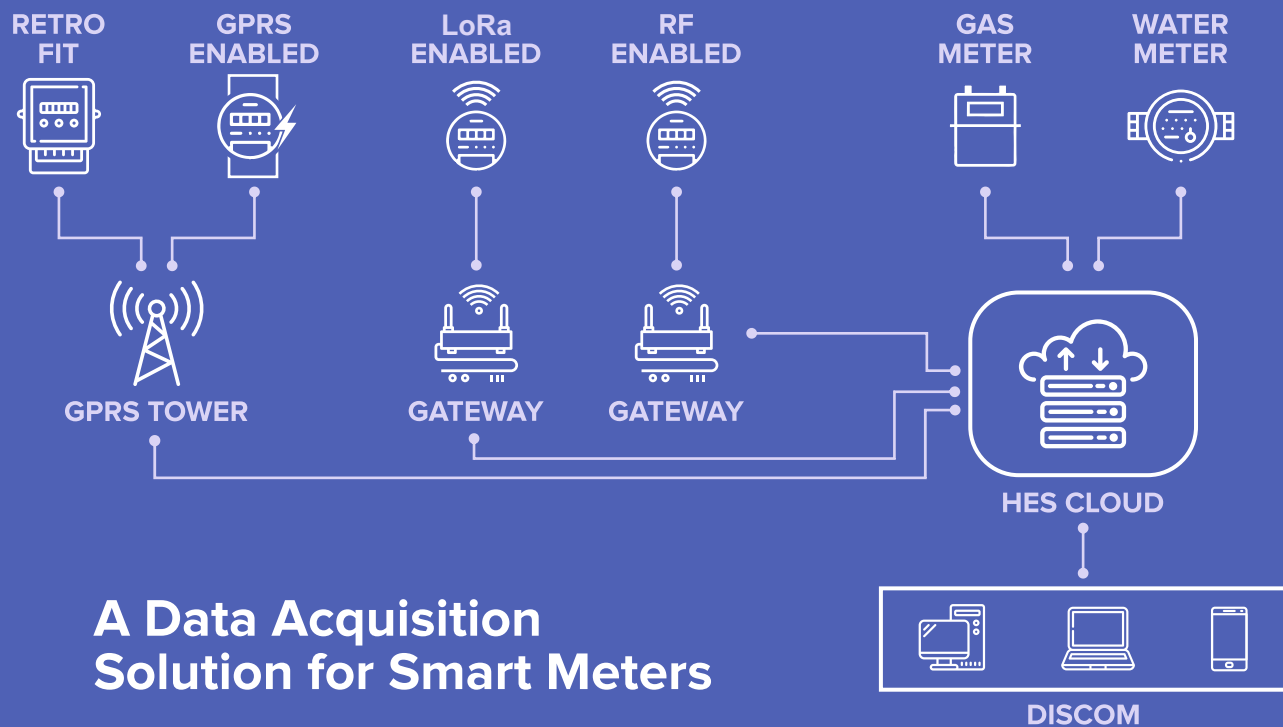

Empowering

Smart Gas Management

The Head-End System (HES) is the central intelligence hub of a smart gas metering network. It seamlessly communicates with smart gas meters deployed across residential, commercial, and industrial areas to collect consumption data, send remote commands, and deliver real-time insights into the gas distribution system. Whether integrated with AMR (Automatic Meter Reading) or AMI (Advanced Metering Infrastructure), the HES ensures secure, reliable, and uninterrupted data exchange between field devices and utility platforms, enabling smarter energy management, enhanced safety, and improved operational efficiency.

Functions

- Real-time data collection from all connected gas meters across multiple locations in one unified platform
- Automated billing based on accurate, real-time consumption data
- Real-time visualizations of consumption patterns, pressure data, and meter performance for actionable insights
- Continuous monitoring with customizable reports for operational and regulatory needs
- Instant alerts for leaks, tampering, pressure drops, or abnormal usage behavior
- Unified System for Gas Management

Features

- Manage gas metering operations from a single unified interface, with support for multi-utility integration (electricity, water, etc.)
- Real-time and scheduled meter reading from all connected endpoints, backed by a secure and scalable data infrastructure
- Automates data acquisition from thousands of smart gas meters using LoRaWAN, NB-IoT, RF Mesh, or GSM communication networks
- Monitors for pressure drops, flow anomalies, helping reduce unaccounted gas and ensure system safety
- Detects and alerts in real-time for tampering and abnormal consumption patterns, enabling swift corrective actions and minimizing safety risks

Advantages

1. **Accurate & real-time data** - Provides precise, real-time tracking of gas consumption, eliminating manual errors and enabling transparent billing.
2. **Leak Detection & Alerts** - Instantly identifies gas leaks, pressure drops, or abnormal usage and notifies both consumers and utility providers to prevent hazards.
3. **Operational Efficiency for Utilities** - Reduces field visits and manual interventions, supports demand forecasting, and improves infrastructure reliability.
4. **Enhances Safety & Compliance** - Continuous monitoring helps ensure regulatory compliance and supports timely action in case of tampering or unsafe conditions
5. **Efficient Billing** - Enables automated billing based on actual gas usage and supports both prepaid and postpaid billing systems.
