

HES for Water Metering

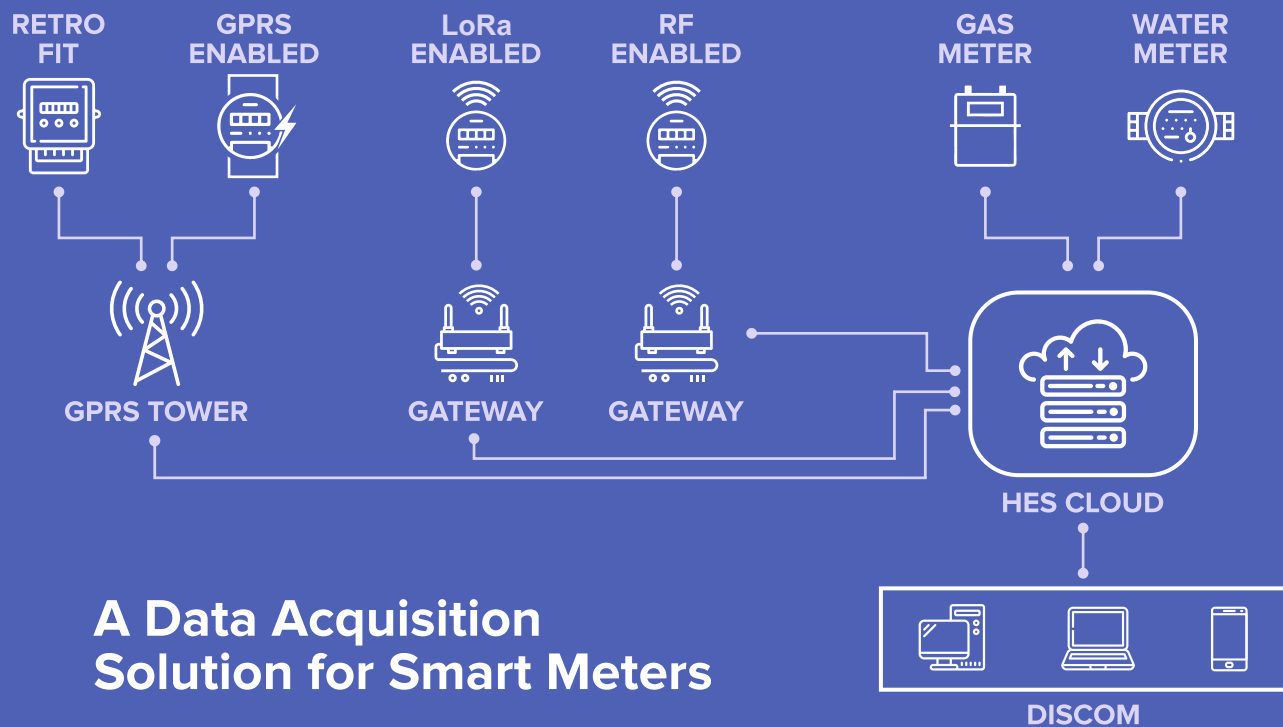

Empowering Smart Water Solutions

The **Head-End System (HES)** is the central command center for a smart water metering network. It communicates with smart meters deployed across residential, commercial, and industrial zones to gather usage data, send commands, and provide real-time visibility into the water distribution ecosystem. Whether integrated with AMR (Automatic Meter Reading) or AMI (Advanced Metering Infrastructure), HES ensures secure and uninterrupted communication between meters and utility platforms.

Functions

- Collects real-time consumption data from all connected meters across locations in a unified repository
- Automatically generates accurate bills based on real-time usage data, streamlining the revenue cycle
- Offers intuitive, real-time visual insights into consumption trends, meter status, and operational metrics
- Provides continuous system monitoring and generates detailed, customizable reports for operational and regulatory needs
- Triggers instant alerts for abnormal usage, leakages, or system faults, enabling timely action and reduced water loss
- Unified System for Water Management

Features

- Manage water metering from a single interface, also supports multi-utility integration (Electricity, Gass, etc.)
- Real-time and scheduled meter reading from all endpoints, secure and scalable data storage architecture
- Automates data reading from thousands of smart water meters using LoRaWAN, NB-IoT, RF Mesh, or GSM networks
- Identifies unexpected continuous flow or backflow and prevents water loss, and reduces non-revenue usage
- Detects and notifies about critical events like leaks, tampering, or abnormal usage to enable quick action

Advantages

1. **Accurate & real-time data** - Provides precise, real-time monitoring of water usage & eliminates manual reading errors and estimated billing.
2. **Leak Detection & Alerts** - Instantly detects leaks or abnormal usage and sends alerts to users and utility providers, preventing water loss and damage.
3. **Operational Efficiency for Utilities** - Reduces manpower and operational costs, enables demand forecasting, and optimizes resource allocation.
4. **Promotes Water Conservation** - Encourages responsible usage through usage insights and alerts, also helps to identify overconsumption and areas for saving
5. **Efficient Billing** - Enables automated billing based on actual consumption. Supports prepaid and postpaid models.
