

Network Management System

Network Management System – NMS is a smart software platform that helps you monitor, manage, and control your full network — including border routers, repeaters, and end devices — all from one simple dashboard. Whether it's for smart meters, streetlights, or industrial sensors, this tool gives you full control of your connected devices in real-time.

Functions

- **Border Router Management** – Add, configure, and monitor Border Routers with remote access, real-time logs, device history, battery status, and hop-based network visualization.
- **End Nodes & Repeaters** – Onboard nodes manually or in bulk, run real-time diagnostics, view historical data, analyze live performance, and deploy OTA firmware updates.
- **Mesh Network Intelligence** – Auto-discover nodes with topology mapping, hop-level routing views, parent-child mapping, and visualization of RSSI, neighbors, and rank.
- **Advanced Tools** – Manage firmware in groups, monitor events and alerts, trigger multicast actions, review authentication logs, and configure servers and batteries.

NMS End-to-End Architecture (For Transportation Layer Communication)

Features

1. **Track Every Device** – Monitor online/offline status, signal strength, battery levels, and last communication of every device.
2. **Add and Manage Devices Easily** – Add single or bulk devices via CSV, assign names, locations, and roles, and place them on a live map.
3. **Monitor Network Health** – Receive alerts for tampering, low battery, or issues, view live network graphs, and access device logs.
4. **Remote Actions** – Restart devices, update firmware via FOTA, and change configurations without field visits.
5. **Dashboard at a Glance** – View total devices, firmware versions, live maps with clusters, and graphs of uptime and trends.
6. **Safe and Secure** – Protect access with passwords and roles while logging all actions for audits.

Applications

Built For – Utility companies, industrial IoT systems, and smart city infrastructure.

Why Choose Our NMS?

1. **Saves Time and Manpower** – Automates network tasks and reduces the need for field visits.
2. **Increases Uptime and Reliability** – Detects issues early and keeps devices connected longer.
3. **Scales Effortlessly** – Designed for large wireless mesh networks with thousands of devices.
4. **Simple Yet Powerful** – Easy-to-use interface delivering advanced insights and control.

Systems Level Solutions (I) Pvt. Ltd.

32, D4, Phase 1, GIDC Estate, V.U. Nagar, Gujarat 388 121, India.
Tel.: +91-2692-232 501/502 (Ext. 53) | Web: www.slscorp.com

Public & Private Deployment

Nebulae NMS server has various deployment models for it's users:

- 1.Public Cloud
- 2.Private Cloud (Managed and hosted in your own infrastructure)
- 3.Dedicated Cloud (Managed & Hosted by Nebulae)

Public Cloud

Private Cloud

(Managed and hosted in your own infrastructure)

Dedicated Cloud

(Managed and hosted by Nebulae)
