

HES FOR SMART METERING

An IoT Based Energy Management Solution

A STEP TOWARDS THE SMART GRID INITIATIVE

HES for Smart Metering is our scalable Head End Data acquisition solution for Advanced Metering Infrastructure (AMI). The IoT based solution monitors & controls smart meters operating as a communication driver between MDM Systems and measurement devices. The HES collects system-wide telemetry data & enables integration with smart energy devices with seamless interoperability, enhancing business intelligence, operational efficiency and system-wide remote device management.

FUNCTIONS

Provides platform-wide connectivity between field devices & enterprise-level software

Manages & stores the acquired meter data enabling remote device management

Integrates seamlessly using REST APIs.

A DATA ACQUISITION SOLUTION FOR SMART METERS

DESCOMs

FEATURES

- Provides seamless integration with billing, data management and enterprise-level AMI applications using REST APIs.
- Compatible with IS16444 based Smart Energy Meters.
- Establishes connectivity using RF Technology and Wi-SUN.
- Highly scalable and secure data acquisition layer.
- Enables remote configuratoin/firmware upgrade/identity/access management of field devices.
- Uses DLMS/COSEM protocol for meter data acquisition.

ADVANTAGES

- Displays collected data using GUI (Graphical User Interface).
- Provides site-specific information enabling intelligent business decisions.
- Monitors, analyses and manages numerous field meters.
- Uses standard connectors for third party AMI applications like MDM, Billing, etc.

HES for Wi-SUN

Head End System (HES) supports seamless communication with Wi-SUN-based DLMS Smart Electricity Meters.

HES communicates with Wi-SUN-based meters through Wi-SUN Gateways and Network Servers. With a feature-rich head-end system, it facilitates Smart Electricity Meter management and monitoring.
